

1.

Ovarian Stimulation

The donor's hormonal treatment (10-12 days) will begin on the 2nd day of her period and it will be monitored by ultrasound scans.

1.1

Preparing the endometrium

The recipient prepares her endometrium at the same time as her partner is undergoing ovarian stimulation.

2.

Follicular Puncture

Oocytes are retrieved through transvaginal puncture - aspiration.

3.

Sperm

The best spermatozoa are selected from the donor's sperm sample.

4.

Fertilisation

The best spermatozoa are selected from a donor sperm sample and microinjected into each egg (ICSI microinjection).

5.

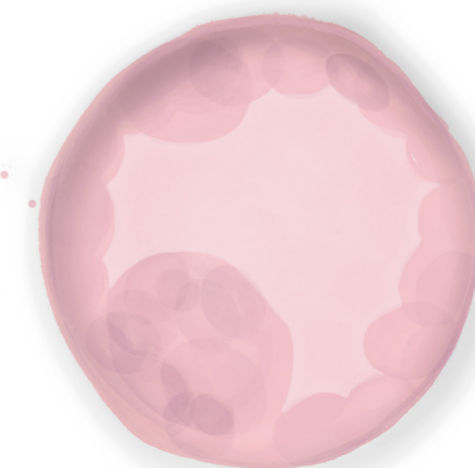

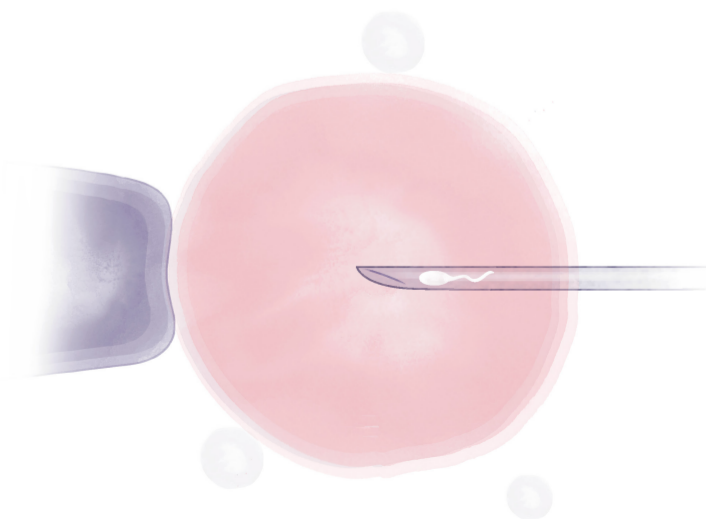

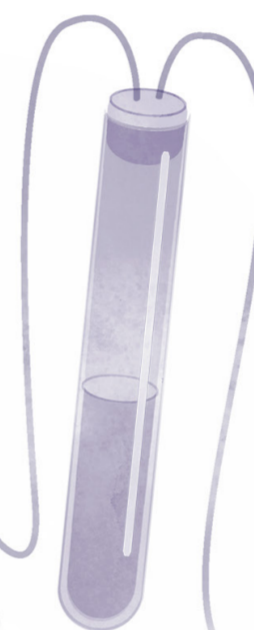

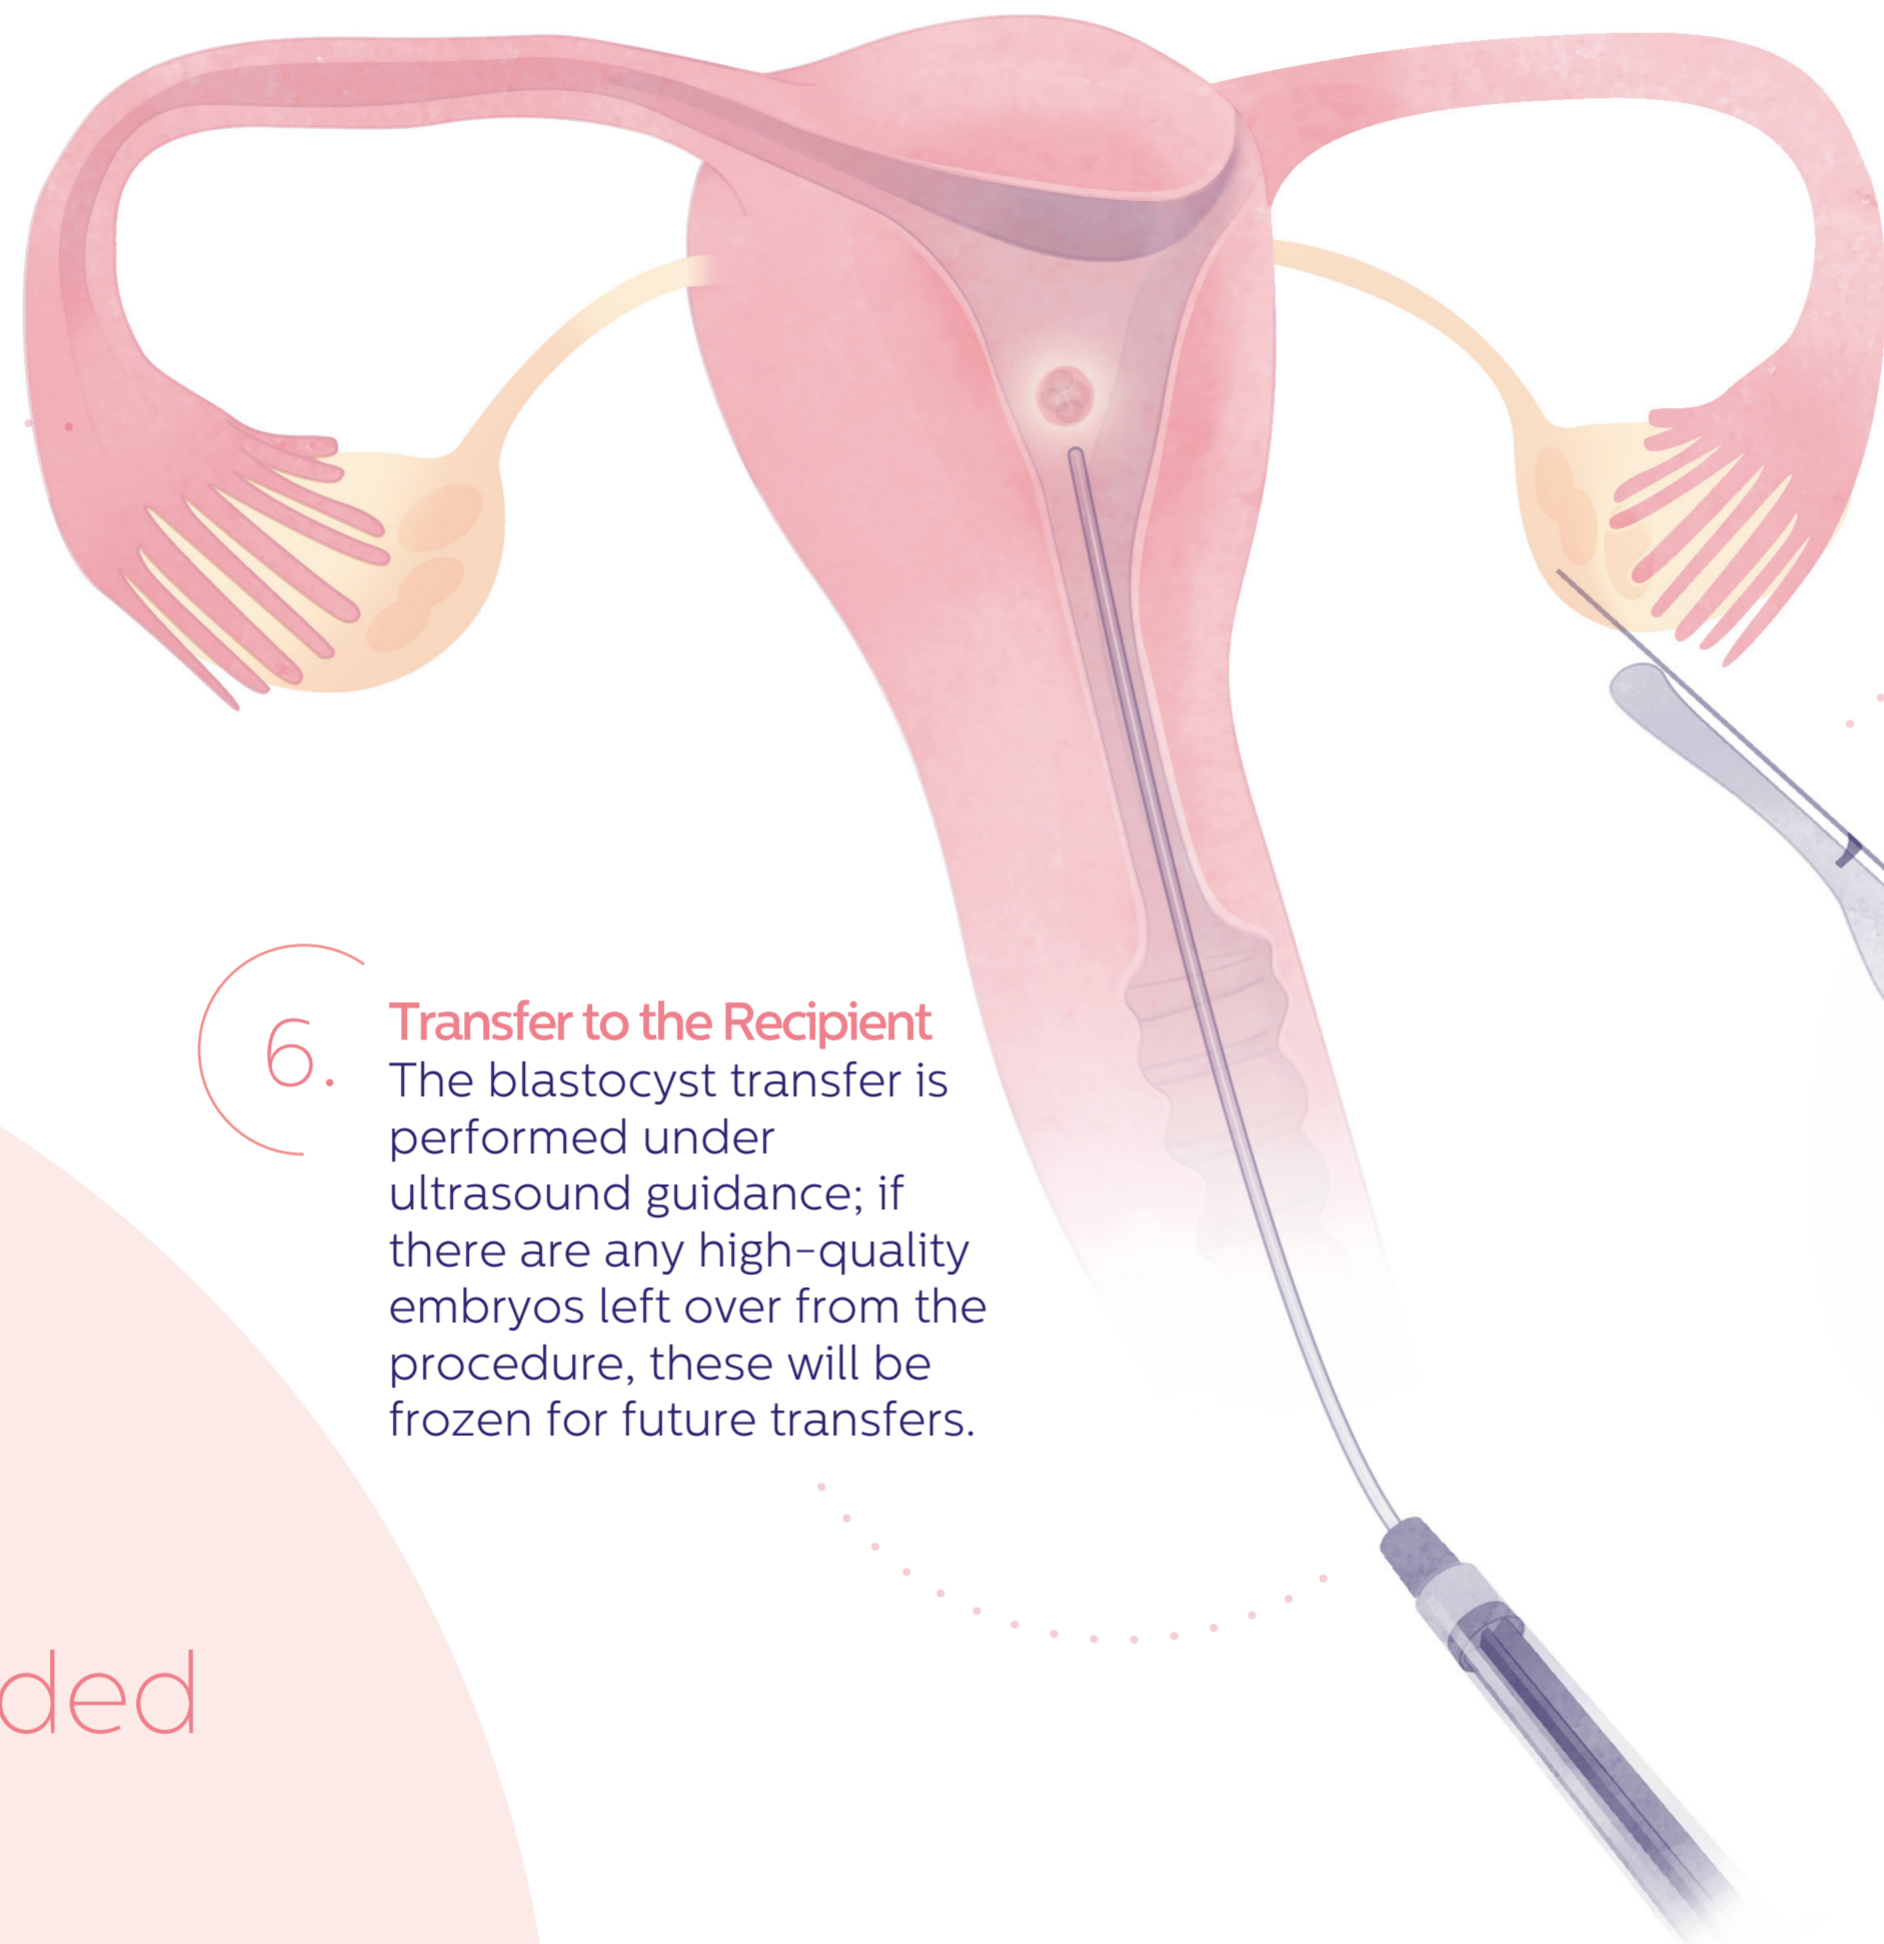

Embryo Cultivation

We keep the embryos in our incubators until they reach the blastocyst stage.

7.

Pregnancy Test

10 days later you will take a pregnancy test.

Who is it recommended for?

- Female couples that wish to share maternity
